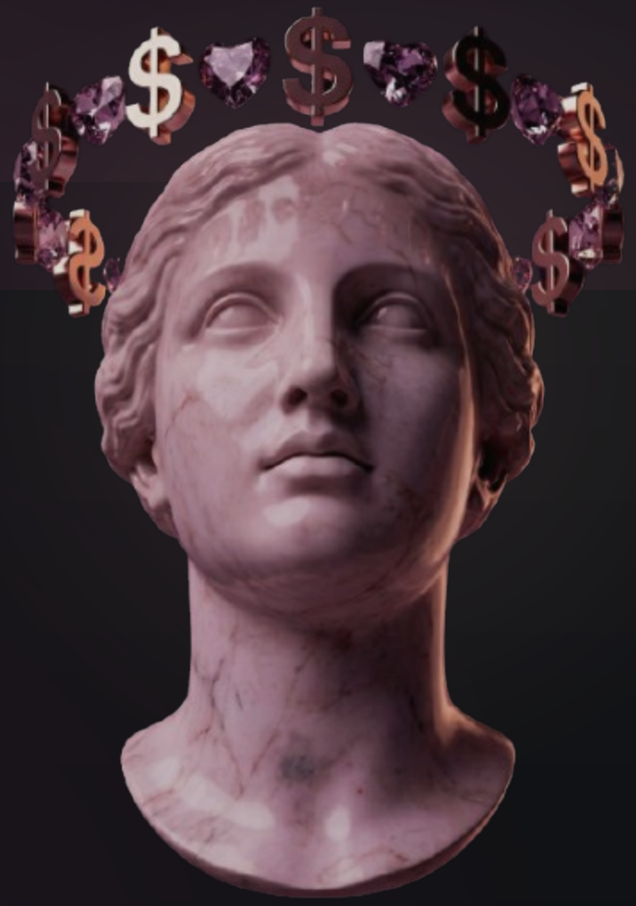
LESSON 3

Geo Targeting & Distribution Control

Posting and Scaling on Your Social Media Accounts, the Trick Which Converts Viewers into Followers

AI INFLUENCER METHOD



LESSON 3: GEO TARGETING & DISTRIBUTION CONTROL

Not all followers are equal. A follower from the USA is worth significantly more than a follower from a non-English-speaking country. Geo targeting ensures your content reaches the right audience — people who actually convert to paying subscribers.

Why Geo Targeting Matters

- US/UK/Canada/Australia audiences have highest conversion rates
- English-speaking fans are more likely to subscribe and pay
- Non-target audiences inflate follower count but kill revenue
- Algorithm learns from your early audience — bad targeting compounds
- 100 US followers > 10,000 non-target followers for revenue

How to Control Distribution

- Use English only in all captions and bios
- Post during US peak hours (EST/PST time zones)
- Engage with US-based accounts and creators
- Use location tags for US cities when available
- VPN to US during all platform activity

Platform-Specific Targeting

- Instagram: Use Insights to monitor audience demographics — if non-US audience grows past 30%, adjust strategy
- TikTok: Set content language to English, target US in settings if available
- Reddit: Post in English-language subreddits only
- Twitter: Engage with US-centric accounts and conversations

REBRANDING TRIGGER

If your audience skews heavily non-English despite correct targeting, it may be time to rebrand. Start a fresh account with stricter targeting from Day 1. A clean restart is better than building on a bad audience foundation.
