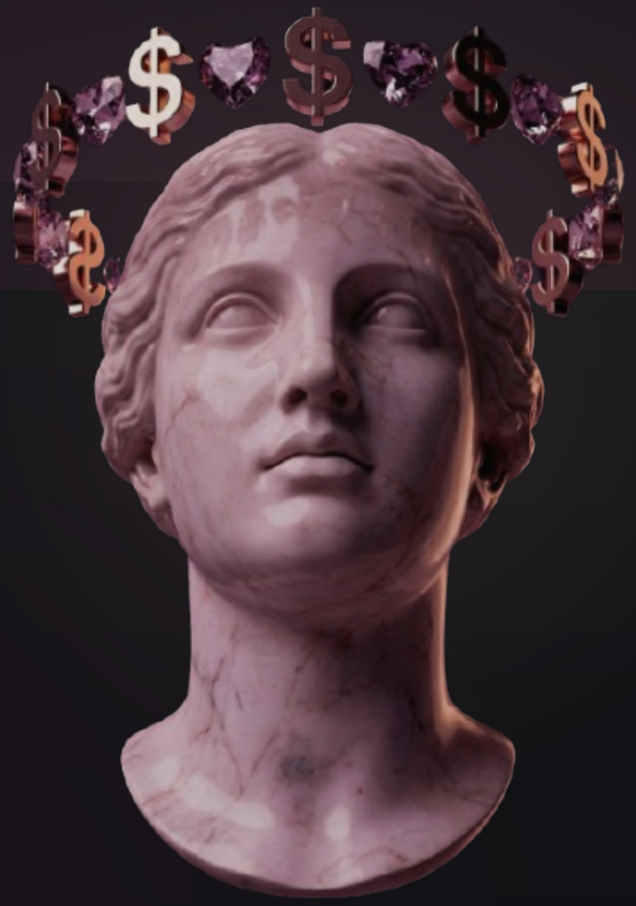
LESSON 3

Exporting & Using Videos on Social Media

Learn Motion Control with Kling and How to Generate Video Prompts

AI INFLUENCER METHOD



LESSON 3: EXPORTING & USING VIDEOS ON SOCIAL MEDIA

Generating a video is only half the job. You need to export it in the right format, at the right resolution, and post it with the right strategy for each platform. This lesson covers the final steps from Kling output to published content.

Export Settings

- Resolution: 1080x1920 for Reels/TikTok (9:16 vertical)
- Resolution: 1080x1080 for feed posts (1:1 square)
- Format: MP4 is universal
- Duration: 3-15 seconds is ideal for most platforms
- Check for artifacts or glitches before exporting

Platform Posting Strategy

- Instagram Reels — Add trending audio, hashtags, and a hook caption
- TikTok — Similar to Reels, keep it native-feeling
- Instagram Stories — Use raw-feeling clips for authenticity
- Fanvue — Longer or more intimate clips for subscriber content

Quality Checklist Before Posting

- Face matches your base model consistently
- No weird hand/finger movements
- Motion looks natural, not robotic
- No visual glitches or frame jumps
- Audio (if added) syncs properly

PRO TIP

Start simple. A 5-second clip of your AI model looking at the camera with a subtle smile and a slow zoom-in will outperform a complex, glitchy 15-second video every time. Master the basics before trying advanced motion.
