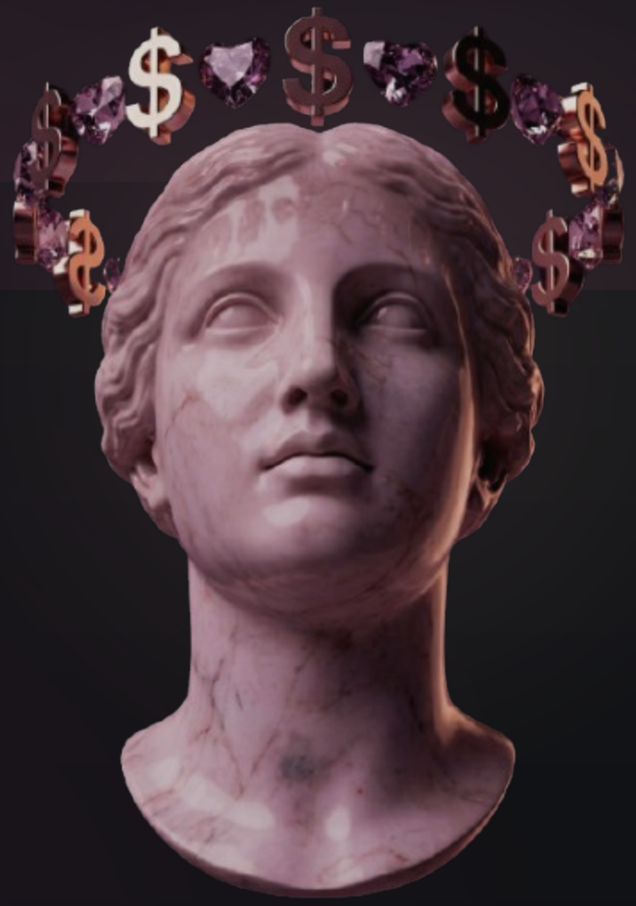
MODULE 8
LESSON 1

Understanding Platform Bans & Shadowbans

Learn How to Protect Your Social Media Accounts from Bans and What to Do if It Happens

AI INFLUENCER METHOD



LESSON 1: UNDERSTANDING PLATFORM BANS & SHADOWBANS

There are two types of bans: visible bans and invisible bans. Visible bans are when the platform tells you directly. Invisible bans (shadowbans) are far more dangerous because you will not know it happened until your growth flatlines. Understanding both is critical to protecting your accounts.

Types of Platform Actions

- Content removal — single post taken down (warning level)
- Temporary restriction — limited features for 24-72 hours
- Shadowban — content stops being shown to non-followers (invisible)
- Account suspension — temporary lockout requiring appeal
- Permanent ban — account deleted, usually not recoverable

What Triggers Flags

- Posting suggestive content too early (no trust built)
- Aggressive follow/unfollow behavior
- Spam-like posting patterns (too much, too fast)
- Link sharing during warmup phase
- Multiple accounts on same device/IP behaving identically
- Reports from other users

Shadowban Detection

A shadowban will NOT show a notification. Your content simply stops reaching new people. The only way to detect it is by monitoring your metrics.

- Instagram: Check Insights — if 'reach from non-followers' drops to near zero, you are likely shadowbanned
- TikTok: If views suddenly drop from thousands to double digits
- Twitter: Use shadowban checking tools to verify
- Reddit: If your posts get zero upvotes consistently in subreddits where they used to perform

WARNING

By the time you notice a shadowban, it has usually been active for days. Check your metrics daily. Early detection = faster recovery.
