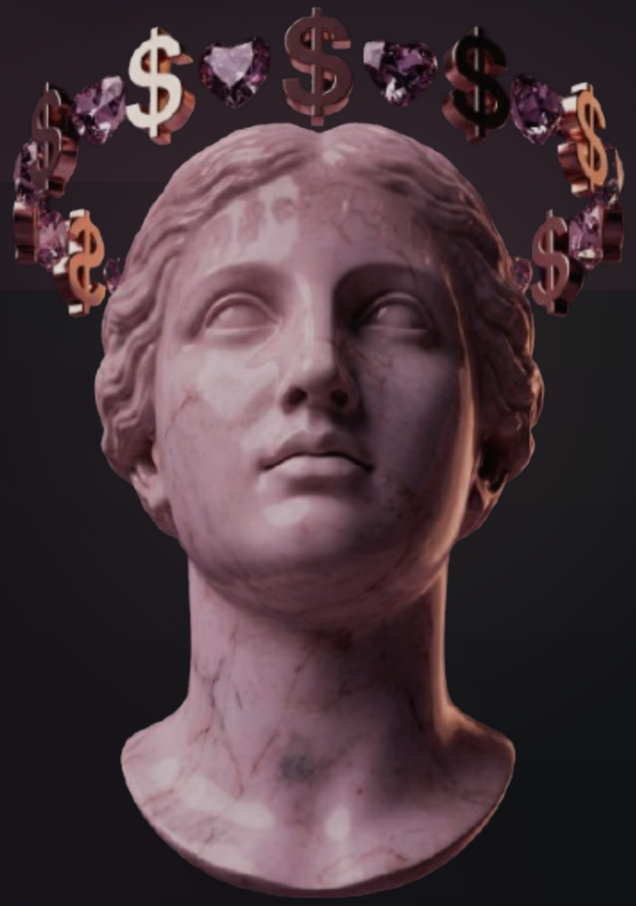
LESSON 2

Writing Video Prompts for Kling

Learn Motion Control with Kling and How to Generate Video Prompts

AI INFLUENCER METHOD



LESSON 2: WRITING VIDEO PROMPTS FOR KLING

Kling video generation is prompt-driven, just like image generation. But video prompts require you to think about motion, timing, and camera behavior — not just static appearance. A good video prompt describes what happens, not just what the scene looks like.

Video Prompt Structure

- → Start with the source image (your AI model image)
- → Describe the motion: what moves and how
- → Describe camera behavior: static, slow pan, zoom in
- → Describe the mood: calm, energetic, playful, intimate
- → Keep it simple — less motion = more realistic output

GOOD EXAMPLE:

Prompt: 'Slow zoom in on woman's face, she looks at camera and gives a soft smile, slight head tilt to the right, wind gently moves her hair, natural daylight'

BAD EXAMPLE:

Prompt: 'Girl dancing and spinning around while the camera flies in circles'
(Too much motion — will produce distorted, unrealistic output)

Motion Control Tips

- One motion at a time produces the cleanest results
- Subtle movements look more realistic than dramatic ones
- Head turns, hair movement, and blinking are the easiest wins
- Camera zoom-in works better than camera panning
- Avoid full body movement — it's the hardest to get right
