LESSON 1: REFERENCE IMAGE WORKFLOW

The reference image workflow is the backbone of your content pipeline. Instead of writing prompts from scratch and hoping for good results, you find real photos that have the exact pose, lighting, and setting you want — then you recreate them with your AI model. This is how you produce content that looks like a real photoshoot, not random AI generations.

Nano Banana 2 is your main tool for all SFW image generation. The workflow is simple: find a reference image on Pinterest, generate a JSON prompt from it, then feed that JSON prompt into Nano Banana 2 along with your base model image. The output matches the reference image's pose and lighting — but with your AI model's face and body.

The Reference Workflow

- → Find a reference image on Pinterest with the pose, lighting, and setting you want
- → Generate a JSON prompt from that reference image
- → Feed the JSON prompt into Nano Banana 2 along with your base model image
- → Nano Banana 2 generates an image that copies the pose and lighting from the reference — but with your AI model
- → Generate at least 3 outputs and compare — pick the one that best matches your model's face
- → If the face drifts, regenerate — do not settle for inconsistent results

Finding Good Reference Images

- Pinterest is your main source — search for poses, outfits, and settings you want to recreate
- Look for images with clear lighting and simple backgrounds — these produce the best results
- Save references into categories (casual, glam, gym, selfie, etc.) so you always have ideas ready
- The better the reference image, the better your output — do not use blurry or cluttered photos

Common Mistakes in Reference Workflow

- Using blurry or low-quality reference images from Pinterest — find clean, well-lit photos
- Picking reference poses that are too complex — start with simple, natural poses
- Ignoring face drift on 'almost good enough' images — never post a drifted face
- Only generating one version — always generate at least 3 and pick the best
- Not saving your working JSON prompts — keep a library of prompts that produce good results

LESSON 2: PROMPT ENGINEERING & EDITING AI IMAGES

Why JSON Prompts Beat Traditional Prompts

Your prompt is everything. JSON prompts are the best way to prompt because they carry far more data about posing, lighting, camera settings, and environment than a traditional text prompt ever could. A JSON prompt specifies exact depth of field, shadow behavior, color temperature, and composition — details that get lost in a one-line text prompt. The AI gets structured instructions for every aspect of the image instead of guessing.

BAD EXAMPLE:

Traditional prompt:
'Woman walking on city street, blue gingham outfit, sunny day, fashion photography, photorealistic'

This tells the AI nothing about pose, lighting direction, camera angle, depth of field, color grading, or composition. You get random results every time.

GOOD EXAMPLE:

JSON prompt advantage:
→ Composition: exact framing, crop, camera angle, depth of field
→ Subject: specific wardrobe details, expression, gesture
→ Environment: location elements, architectural details
→ Lighting: source, direction, color temperature, shadow behavior
→ Technical: focal length, aperture, ISO, sharpness
→ Artistic: aesthetic, mood, stylistic influences, texture rendering

Every detail is specified — nothing is left to chance.

Example JSON Prompt

EXAMPLE JSON PROMPT:

```
{
  "prompt_modifiers": ["character from reference images"],
  "image_type": "outdoor fashion street portrait",
  "composition": {
    "framing": "vertical, mid-thigh crop",
    "camera_angle": "eye-level perspective",
    "pose": "walking forward on sidewalk, torso facing camera",
    "depth_of_field": "moderate, subject sharp, background blurred"
  },
  "subject": {
    "wardrobe": "blue gingham button-up top, matching mini skirt, brown suede handbag",
    "expression": "composed, neutral with soft direct gaze"
  },
  "environment": {
    "location_type": "urban street setting",
    "elements": ["storefront windows", "stone facade", "paved sidewalk"],
    "style": "luxury shopping district"
  },
  "lighting": {
    "source": "natural direct sunlight",
    "direction": "front-side from upper left",
    "color_temperature": "warm daylight (~5600K)",
    "shadows": "soft shadow outlines on ground"
  },
  "technical_characteristics": {
    "focal_length": "28-35mm",
    "aperture": "f/2.8-f/4",
    "sharpness": "high with clear fabric texture"
  },
  "artistic_elements": {
    "aesthetic": "chic European summer street style",
    "mood": "confident, polished, effortless"
  }
}
```

How to Generate JSON Prompts

- → Find your reference image on Pinterest
- → Feed it into an AI and ask it to generate a JSON prompt describing everything about the image
- → The AI breaks down pose, lighting, environment, camera settings, and style into structured JSON
- → Feed that JSON prompt into Nano Banana 2 along with your base model image
- → The output matches the reference's pose and lighting — but with your AI model

> **PRO TIP**
>
> Save every JSON prompt that produces good results. Build a library organized by scene type (street, cafe, gym, beach, home, etc.). When you need new content, grab a working JSON prompt, swap out the wardrobe and environment details, and generate. This is how you produce dozens of images efficiently without starting from scratch.

Raw AI outputs are rarely perfect. Even the best generations need minor editing before they are ready to post. This lesson covers what to look for, how to fix common issues, and the critical trick that makes AI images pass as real photos. Skipping the editing step is how pages get exposed as AI.

Common Issues to Fix

- Extra or distorted fingers/hands — the most common AI artifact
- Asymmetric facial features — one eye larger or different height
- Text or watermark artifacts in background — AI loves generating fake text
- Unnatural skin smoothing or plastic shine — too perfect is too fake
- Weird jewelry, accessories, or clothing seams that break reality
- Background inconsistencies — impossible geometry, blending errors, floating objects

Editing Workflow

- → Step 1: Inspect hands and fingers first (most common issue)
- → Step 2: Check face symmetry and eye alignment
- → Step 3: Scan background for text, artifacts, or impossible geometry
- → Step 4: Adjust color grading for natural skin tones
- → Step 5: Add approximately 2% grain/noise for realism (critical step)
- → Step 6: Crop or reframe for platform-specific aspect ratios
- → Step 7: Export at appropriate resolution

Editing Tools (Free Options)

- Photopea (photopea.com) — Free browser-based Photoshop alternative. Handles everything you need
- GIMP — Free desktop app for advanced editing
- Canva — Basic cropping, filters, and text overlay
- Snapseed — Mobile editing for quick adjustments
- For most editing tasks, Photopea is all you need

> **IMAGE PLACEHOLDER**
>
> Before/after examples of common AI artifacts being fixed: distorted hand corrected, background text removed, skin smoothing reduced, asymmetric eyes fixed

The Grain Trick — Critical

This is the single most important editing technique in this entire course. Raw AI images look too clean, too smooth, too perfect. Real photos from phones have subtle grain and noise. Adding approximately 2% grain in your editing tool makes AI images pass as real.

- In Photopea: Filter → Noise → Add Noise → set to 2-3%, Gaussian, Monochromatic
- This simulates camera sensor noise that exists in every real photo
- Without grain, experienced eyes can spot AI images immediately
- The difference is subtle but it is the difference between 'this looks real' and 'this looks AI'
- Apply grain as the very last step before export

> **IMAGE PLACEHOLDER**
>
> Side by side comparison: Raw AI output (too smooth, no grain, plastic-looking) vs Edited output (grain added, color corrected, natural-looking). Label the differences clearly.

Nano Banana 2 Edit Feature — Fixing Specific Areas

When a generated image is almost perfect but has one bad area (a distorted hand, a weird background element), use the edit feature in Nano Banana 2 to fix just that area without regenerating the entire image.

- Use the edit feature in Nano Banana 2 to select the problem area
- Write a prompt describing what should be in that area
- Nano Banana 2 regenerates only the selected region while keeping everything else
- This saves images that would otherwise be rejected entirely
- Use it for: hands, background artifacts, clothing seams, jewelry errors

> **RULE**
>
> Do not over-edit. The goal is to fix obvious AI artifacts and add grain, not to create a heavily processed image. Over-edited photos look fake in a different way. Fix the problems, add grain, and stop. Natural-looking beats polished-looking every time.

LESSON 3: PLATFORM-SPECIFIC IMAGE RULES

Each platform has different content guidelines. What works on Reddit will get you banned on Instagram. Understanding what is 'safe' per platform prevents account strikes and keeps your content flowing without interruption. One wrong post can shadowban your account for weeks. Know the rules before you post.

Instagram (Strictest)

- No nudity, implied or explicit — zero tolerance
- No underwear as primary clothing (bras/panties as the outfit)
- Cleavage must be modest and natural — no extreme push-up
- Swimwear is allowed in context (beach, pool settings only)
- No sexual poses or suggestive hand placement
- No sexual captions or innuendo in text
- AI-generated content is increasingly flagged — realism is critical

TikTok (Strict)

- Similar rules to Instagram, often stricter enforcement
- Carousels and photo content are the safest format
- Avoid anything that could be flagged as 'adult content'
- When in doubt, keep it casual and fully clothed
- TikTok's moderation is faster and harsher than Instagram's
- One content strike can shadow your account for weeks

Reddit (Most Flexible)

- Rules vary dramatically by subreddit — always read before posting
- SFW subreddits still require tasteful, appropriate content
- Some SFW subs allow swimwear, others do not
- NSFW subreddits have their own specific content rules
- Mark your profile as NSFW in settings before any NSFW posting
- Moderators are human and strict — one violation can get you permanently banned from a subreddit

Twitter/X (Flexible)

- More lenient than Instagram overall
- SFW content actually performs better for discovery and growth
- Mark sensitive content appropriately in media settings
- Keep main feed clean — use the sensitive content flag for anything borderline
- Explicit content is allowed but must be properly marked

IMAGE PLACEHOLDER

Platform safety scale: horizontal gradient from 'Strictest' to 'Most Flexible'. Left: TikTok → Instagram → Threads → Twitter/X → Reddit. Show what's allowed at each level with checkmark and X icons for content types.

Threads (Moderate)

- Linked to Instagram — violations can affect your IG account
- Text-based posts are safest for Threads
- Optional photo attachments should be SFW casual only
- No explicit images, no suggestive poses in attached photos
- Keep it conversational — Threads is for personality, not photos

The 'When In Doubt' Decision Process

- Is the outfit something you would see at a mall? → Safe for Instagram/TikTok
- Is there visible underwear as the main outfit? → Not safe for Instagram
- Would this photo make you uncomfortable if your boss saw it? → Borderline — test with a trial post first
- Could this be interpreted as sexual? → Do not post on Instagram or TikTok

> **GOLDEN RULE**
>
> When in doubt, keep it safe. One content strike on Instagram can shadow your account for weeks. It is always better to post something slightly too modest than to risk a ban. You can always push boundaries gradually once trust is established — you cannot undo a strike.

END SUMMARY

- Always generate new images using your base model as a reference in Nano Banana 2
- Write detailed prompts with setting, lighting, outfit, and camera angle — save templates that produce good results
- Use Photopea (free) to export Instagram carousels — this helps avoid the AI filter on Instagram
- Always add approximately 2% grain/noise as the final editing step — this is what makes AI images pass as real photos
- Use the edit feature in Nano Banana 2 to fix specific problem areas without regenerating the entire image
- Know each platform's content rules — TikTok and Instagram are strictest, Reddit is most flexible
- When in doubt, keep it safe — a content strike can derail weeks of progress
