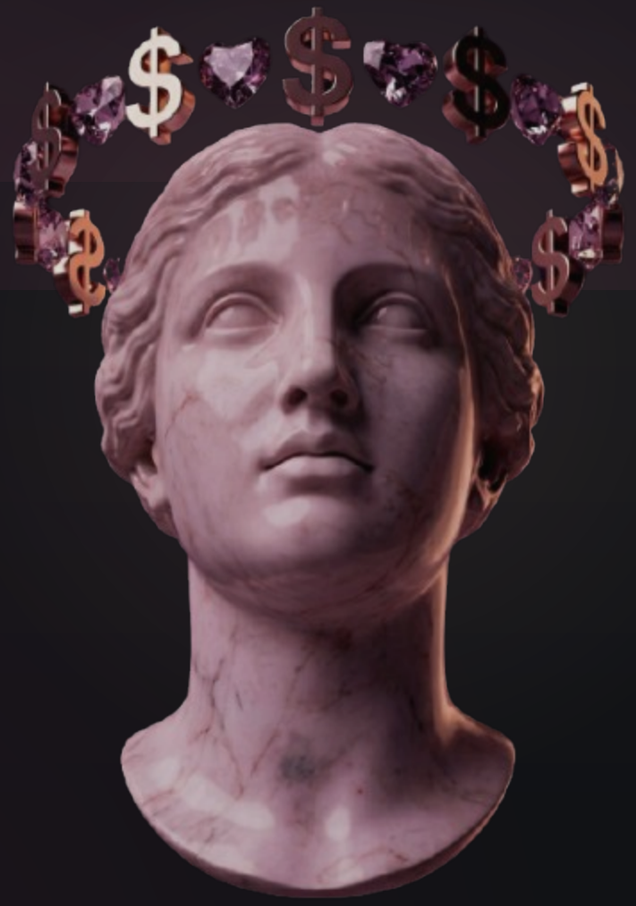
MODULE 4
LESSON 3

Lip Sync & Advanced Features

Learn Motion Control with Kling and How to Generate Video Prompts

AI INFLUENCER METHOD



LESSON 3: LIP SYNC & ADVANCED FEATURES

Lip sync is one of the most powerful features in Kling. It makes your AI model appear to speak with synced lip movements. A 5-second clip of your model 'talking' directly to camera is incredibly convincing and dramatically outperforms standard motion clips for engagement. This is what makes your persona feel real.

How Lip Sync Works

- Upload your source image (clear front-facing shot, mouth visible)
- Provide audio input — either record a voice clip or use text-to-speech
- Kling syncs the lip movements to match the audio
- Output: your model appears to be speaking the words naturally
- Works best with clear, front-facing portraits where the mouth is fully visible

Best Practices for Lip Sync

- Use a clear, well-lit front-facing image — the face must be prominent
- Audio should be clear with minimal background noise
- Keep clips short: 3-7 seconds produces the most natural results
- Simple phrases work better than long monologues
- Text-to-speech voice should match your persona's aesthetic (young, warm, casual)
- Review output carefully — lip sync can sometimes drift or look unnatural on certain sounds

Lip Sync Content Ideas

- 'Hey, come talk to me' — Simple CTA for Stories
- 'Good morning' / 'Goodnight' — Daily check-in clips
- Trending audio lip sync — Matches popular Reels format
- Short personality statements — 'I swear I was going to study today'
- Response clips — Appear to reply to comments or questions

Video Extension

Raw Kling output is typically 3-5 seconds. For a 15-30 second Reel, you need to create multiple clips and stitch them together, or use Kling's video extension feature.

- Video Extend lets you continue a generated clip for additional seconds
- Each extension adds 3-5 more seconds of motion
- The AI tries to continue the natural motion from where the clip ended
- Works best when the original clip ends in a natural position (not mid-motion)
- Quality can degrade with multiple extensions — limit to 1-2 extensions per clip
- For longer content, stitch separate clips together in an editor (next lesson)

Face Preservation Tips

The biggest challenge with AI video is maintaining your character's face consistency. Small errors compound over frames — by the end of a long clip, the face can drift.

- Use your best, clearest reference image as the source — quality in = quality out
- Subtle motion preserves faces better than dramatic movement
- Conservative movement settings reduce face drift
- Short clips (3-5 seconds) have better face consistency than long ones
- Always compare the first and last frame — if the face drifted, regenerate
- Professional Mode produces more consistent faces than Standard Mode

IMAGE PLACEHOLDER

Lip sync workflow: Source Image + Audio Input → Kling Lip Sync → Output video showing model appearing to speak. Annotate the steps clearly.
