MODULE 5
LESSON 1

Phone & Device Setup

Learn the essentials of phone & device setup

LESSON 1: PHONE & DEVICE SETUP

Your device setup is the foundation of account safety. Platforms track device IDs, IP addresses, and usage patterns. If you run multiple AI personas from the same phone on the same network, you are asking to get flagged. This lesson covers the correct way to set up your devices before creating a single account.

Device Requirements

- One dedicated phone per persona (ideal setup)
- If sharing a device: max 2 accounts per phone (risky but workable)
- Use separate browser profiles or app clones if needed
- Never log into two personas on the same app simultaneously
- Factory reset any used phone before starting a new persona
- Used phones work perfectly — you do not need the latest model

Network & IP Setup

- Use mobile data (4G/5G) during warmup — not WiFi
- If using WiFi: use a VPN set to a US location
- Each persona should ideally have a different IP footprint
- Never use public WiFi for account activity
- Keep your VPN location consistent — do not jump between cities or countries

SIM Card & Phone Number

- Each account needs a unique phone number for verification
- Prepaid SIM cards work perfectly and are cheapest ($10-$30)
- Virtual numbers (Google Voice, TextNow) are riskier — platforms sometimes flag these
- eSIMs are a convenient option for managing multiple numbers on one device
- Never share a phone number across multiple personas
- Keep a record of which SIM/number belongs to which persona

Essential Apps to Install

- Instagram
- Threads (linked to Instagram)
- TikTok
- Telegram
- VPN app
- Photo gallery app for content storage
- Notes app for captions and prompt templates

VPN Recommendations

Not all VPNs are equal. The type of IP address matters more than the VPN brand.

- Residential proxies — Best option. IPs look like real home connections. Platforms cannot easily detect them
- Mobile proxies — Excellent option. IPs look like real phone connections. Very hard to flag
- Datacenter VPNs (NordVPN, ExpressVPN, etc.) — Workable but riskier. Datacenter IPs are easier for platforms to flag
- For starting out, a quality VPN like NordVPN or Surfshark set to a US city is sufficient
- For scaling to multiple accounts, invest in residential or mobile proxies

Antidetect Browsers & Cloud Phones (Advanced)

For operators scaling beyond their first persona, dedicated phones become expensive. Antidetect browsers and cloud phones let you manage multiple accounts from one machine with isolated fingerprints.

- GoLogin — Manages thousands of browser profiles, each with unique fingerprints. Low cost, good for scaling. Has a native Android app
- GeeLark — Cloud-based Android environments for Instagram warmup. Simulates real device behavior with gradual engagement
- Multilogin — Enterprise-grade, each cloud phone gets unique IMEI, Android ID, MAC address
- These tools are NOT needed for your first persona — start with a physical phone
- Add antidetect tools when you scale to 3+ accounts and need to manage them efficiently

END SUMMARY

- One dedicated phone per persona — never share devices or IP addresses between personas
- Use residential or mobile proxies for best safety — datacenter VPNs are workable but riskier
- Antidetect browsers (GoLogin) and cloud phones (GeeLark) are for scaling beyond your first persona — not needed to start
- Usernames must be human-sounding, memorable, and consistent across all platforms
- No links, no selling language, and no suggestive content during warmup — period
- Instagram warmup: 21-28 days. TikTok: 9 days. Twitter/X: 14 days. No shortcuts exist
- Stay well below platform rate limits during warmup: under 50 likes/hour, under 10 follows/hour on Instagram
- Behave like a real person: scroll, like, comment naturally before posting content
- Most bans happen during warmup because people rush — patience is mandatory and non-negotiable
